# CTS Organizer v2.1

User manual - Firestorm inventory preparation for CTS Wardrobe workflows

**Version 2.1**
Field-tested organizer build for macOS and Windows.

## What CTS Organizer does

CTS Organizer helps prepare clothing and accessory folders in Firestorm by detecting supported body/head targets and creating a CTS-friendly folder structure. It reduces repetitive work such as creating subfolders and placing matching inventory items by hand.

The original purchased product folder is preserved. The organizer creates the prepared structure separately, so the source package remains available as a fallback.

## Quick start

1. In Firestorm Inventory, select the product folder you want to organize.
2. Open CTS Organizer from the inventory menu/context entry.
3. Review the scan result and detected targets.
4. Open **Settings** to change targets, package behavior or folder naming.
5. Run the organizer and inspect the generated folders before using them with CTS Wardrobe.

# Settings

The v2.1 Settings window is a wide, resizable control panel. The main areas are Targets, Heads/Other targets, Per-variant packages, Shared folder names and Folder naming.

## Body targets

**Female:** Lara X, Reborn, Lara, Lara Petite, Freya, Hourglass, Physique, SLink Hourglass, SLink Physique, Kupra, Gen X and Erika.
**Shared/unisex:** Legacy.
**Male:** Legacy Male, Jake, Gianni and Kario.

The option **Automatically filter body targets using avatar shape sex** can use the current avatar shape as a default filter.

## Heads and other targets

Head targets in v2.1 are LeLutka, CATWA, GENUS and LAQ. Unrigged content can also be selected as an Other target.

## Per-variant packages

You can create a separate main folder for each detected variant. Optional HUD and Alpha folders can be created inside each package. Shared folder names for HUD, Alpha and Add On are editable.

# Folder naming

Target detection and output naming are kept separate. Changing an output folder name therefore does not change the classifier's internal target identity.

| Mode | Purpose |
| --- | --- |
| CTS Premium / Matrix | Maps each detected target to the exact subfolder name you want CTS to use. The right-hand value is editable for every configured target. |
| CTS Organizer / Automatic | Uses the Organizer naming path to construct output names automatically. v2.1 includes the automatic suffix setting; deeper classifier-driven item-type naming can be expanded later. |

## Matrix mode

The matrix contains an editable output name for every configured target. This is useful when your CTS setup expects a particular spelling or naming convention. Bodies, male bodies, heads and Unrigged are included in the same matrix.

## Example

**Detected target** -> **Output subfolder**
Lara X -> Lara X
Legacy -> Legacy
Legacy Male -> Legacy Male
LeLutka -> LeLutka

## Recommended workflow

For an existing CTS Wardrobe setup, start with **CTS Premium / Matrix** and make the matrix match the subfolder names your wardrobe already expects. This is the most predictable mode because the output names are explicit.

Use **CTS Organizer / Automatic** when you prefer the Organizer to construct names rather than maintaining an exact target-to-folder mapping.

## Testing checklist

Before processing a large inventory collection, test one product folder and verify:
- expected body/head targets are detected;
- generated folders have the expected names;
- HUD, Alpha and Add On placement matches Settings;
- Matrix names match your CTS Wardrobe triggers;
- the original source folder remains intact.

## Version notes - v2.1

v2.1 expands target configuration, adds male body targets and Erika, supports Heads and Unrigged configuration, adds avatar-shape-sex filtering, introduces the wide Settings panel, retains separate-main-folder behavior, and adds Matrix/Automatic folder naming configuration.
